## Manually operated valves

Manually operated valves are used in all industrial sectors, as well as in the commercial trades. They are used to

carry out simple processes such as clamping or closing safety doors. Depending on the desired actuation

(pushing, rotating/swivelling or tilting), the valves are either detenting or non-detenting. The valves are directly

controlled in some cases or are pneumatically piloted.

 A filter must be installed upstream of valves operated in vacuum mode. This prevents any foreign matter in the intake air getting into the valve (e.g. when operating a suction cup).
